AB The invention relates to a method for changing the glucan chain lengths using **fusion protein** domains of various **starch synthase** enzymes in any starch or starch granule producing organism. The invention relates to identification of a Glucan ASSociation domain (herein after referred to as "GLASS" domain) of granule bound **starch synthase** (GBSS) used in combination with any other GLYcosyl TRansferase domain otherwise referred to as pfam00534-catalytic domain (herein after referred to as "GLYTR" domain) of one or more of any of the other **starch synthase** enzymes. The invention relates to identifying and using the new and surprising discovery that **starch synthases** are composed of at least two distinct functional domains herein after labeled as "GLASS" and "GLYTR". More specifically, this invention relates to the genetic constructs that encode the fusions of the above domains and to the plants transformed with said constructs. The method of invention can thus be used in particular to provide a modified profile of starch granule associated **starch synthase** (SS) enzymes and by which modified glucan chain lengths of amylopectin and hence, modified starches and or complexes will be generated. This can be done in any organism and more particularly any plant that stores or synthesizes starch in any of its parts, such as potato, sweet potato, cassaya, pea, taro, banana, yam and cereal crops such as rice, maize, wheat, barley, oats, and sorghum.

AB Fructose-1,6-bisphosphate aldolase (FDA) is an enzyme reversibly catalyzing the reaction converting triosephosphate into fructose-1,6-bisphosphate. In the leaf, this enzyme is located in the chloroplast (starch synthesis) and the cytosol (sucrose biosynthesis). Transgenic plants were generated that express the E. coli fda gene in the chloroplast to improve plant yield by increasing leaf starch biosynthetic ability in particular and sucrose production in general. Leaves from plants expressing the fda transgene showed a significantly higher starch accumulation, as compared to control plants expressing the null vector, particularly early in the photoperiod, but had lower leaf sucrose. Transgenic plants also had a significantly higher root mass. Furthermore, transgenic potatoes expressing fda exhibited improved uniformity of solids.

AB This invention relates to a method of producing a starch with unique functionality in plants through mutagenesis, and/or using biotechnology, and/or breeding practices. Further the invention relates to the starch from maize plants and/or other plants which produce starch storing organs which contain low amylose starch which has an amylose content between 1.5% and 15% and preferrably between 1.5% and 10% and most preferrably 1.5 and 8%. The invention includes starch extracted from such grain due to at least one mutation induced by ethyl methanesulfonate. Additionally, the invention uses a biotechnology approach involving controlling the activity of the granule bound **starch synthase** enzyme in starch storing organ. The invention includes the use of the starch for its cooking, paste, and gel properties.

AB The present invention provides purified, corn ear-derived polynucleotides (cdps) which encode corn ear-derived polypeptides (CDPs). The invention also provides for the use of cdps or their complements, oligonucleotides, or fragments in methods for determining altered gene expression, to recover regulatory elements, and to follow inheritance of desirable characteristics through hybrid breeding programs. The invention further provides for vectors and host cells containing cdps for the expression of CDPs. The invention additionally provides for (i) use of isolated and purified CDPs to induce antibodies and to screen libraries of compounds and (ii) use of anti-CDP antibodies in diagnostic assays.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB The present invention provides purified, corn tassel-derived polynucleotides (cdps) which encode corn tassel-derived polypeptides (CDPs). The invention also provides for the use of cdps or their complements, oligonucleotides, or fragments in methods for determining altered gene expression, to recover regulatory elements, and to follow inheritance of desirable characteristics through hybrid breeding programs. The invention further provides for vectors and host cells containing cdps for the expression of CDPs. The invention additionally provides for (i) use of isolated and purified CDPs to induce antibodies and to screen libraries of compounds and (ii) use of anti-CDP antibodies in diagnostic assays.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB The present invention relates to nucleic acid molecules encoding enzymes which are involved in the starch synthesis in plants. These enzymes are **starch synthases** from wheat. The invention further relates to vectors and host cells containing said nucleic acid molecules, in particular transformed plant cells and plants regenerated from these cells, which exhibit an increased or a reduced activity of the described **starch synthases**.

			WO 2000-FR1384	W 20000519

AB The invention concerns starch granules containing a **hybrid protein** between a **starch synthase** and a protein of interest, the nucleotide sequences used for obtaining same, methods for preparing them and their uses, particularly in pharmaceutical compns. Thus, the cDNA for the STA2 gene **starch synthase** of *C. reinhardtii* was cloned and sequenced. A C-terminal-truncated **starch synthase** of 58 kilodaltons (wild-type enzyme: 76 kilodaltons) encoded by the sta2-1 allele was found to have a six-fold increased Km for ADP-glucose and to bind to starch grains with unaltered affinity.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB The present invention provides novel transgenic plants with altered sugar levels and methods for producing them. The methods comprise introducing into the plant an expression cassette comprising a promoter sequence operably linked to a polynucleotide sequence substantially identical to a sequence from a gene encoding a protein associated with sucrose biosynthesis.
